

# ONKYO® SERVICE MANUAL

## COMPACT DISC PLAYER MODEL DX-230

### Black model

BUDN, BUD	120V AC, 60 Hz
BUG	220V AC, 50Hz
BUU	110/120/220/240V AC, 50/60Hz
BUQA	240V AC, 50 Hz

### SAFETY-RELATED COMPONENT WARNING!!

COMPONENTS IDENTIFIED BY MARK  ON THE SCHEMATIC DIAGRAM AND IN THE PARTS LIST ARE CRITICAL FOR RISK OF FIRE AND ELECTRIC SHOCK. REPLACE THESE COMPONENTS WITH ONKYO PARTS WHOSE PARTS NUMBERS APPEAR AS SHOWN IN THIS MANUAL.

MAKE LEAKAGE-CURRENT OR RESISTANCE MEASUREMENTS TO DETERMINE THAT EXPOSED PARTS ARE ACCEPTABLY INSULATED FROM THE SUPPLY CIRCUIT BEFORE RETURNING THE APPLIANCE TO THE CUSTOMER.

### SPECIFICATIONS

Signal readout system:	Optical non-contact
Reading rotation:	About 500~200 r.p.m. (constant linear velocity)
Linear velocity:	1.2~1.4m/s
Error correction system:	Cross interleave readsolomon code
Decoded bits:	16 bits linear
Sampling frequency:	88.2kHz (two-times oversampling)
Number of channels:	2 (Stereo)
Frequency response:	5Hz~20kHz
Total harmonic distortion:	0.03% (at 1kHz)
Dynamic range:	93dB
Signal to noise ratio:	96dB
Channel separation:	87dB (at 1kHz)
Wow and Flutter:	Below threshold of measurability
Power consumption:	13 watts
Output level:	2 volts r.m.s.
Dimensions (W x H x D):	435 x 88 x 357mm 17-1/8" x 3-7/16" x 14-1/16"
Weight:	4.8kg, 10.6 lbs.

Specifications are subject to change without notice.

## SERVICE PROCEDURES

### 1. Removing the Locking Plate

Locking plate is located on the bottom panel of this unit. Before using this unit for the first time, the plate must be removed. If power is switched on while this part is still in place, the unit will not operate properly

1. Locking plate
2. Tapping screw

Fig. 1

### 2. Safety-check out (U.S.A. model)

After correcting the original service problem, perform the following safety check before releasing the set to the customer:

Connect the insulating-resistance tester between the plug of power supply cable and chassis.

Specifications: more than 10Mohm at 500V.

### 3. Procedures for replacement of flat packaged ICs

#### 1. Tools to be used:

- (1) **Soldering iron** .... Grounded soldering iron or soldering iron with leak resistance of 10 Mohms or more.

Form of soldering iron's tip:

Fig. 2

- (2) **Magnifying glass** ... for checking of finished works
- (3) **Tweezers** ..... for handling of IC and forming of leads
- (4) **Grounding ring** .... Countermeasure for electrostatic breakdown
- (5) **Nipper** ..... for removing defective IC
- (6) **Small brush** ..... for application of flux

#### 2. Work Procedures:

##### (1) Remove the defective IC

Cut all leads of the defective IC one by one using a nipper and remove the IC.

##### (2) Clean the pattern surface of the PC board.

Get rid of the remaining leads and solder.

##### (3) Check and from the leads of the new flat packaged IC to be installed.

From every lead on the new IC using a pair of tweezers, so that all of them are aligned neatly without being risen, twisted or inclined toward one side. Especially the rising portion of every lead must be formed with greatest care.

Fig. 3

##### (4) Apply flux to the PC board.

Apply flux to the pattern surface of the PC board which has been cleaned, as shown in the illustration. The area to be applied with flux is the portion of about 2.5mm in width where the IC's leads are to be soldered.

Be careful to apply minimum amount of flux required so as not to smear it on unwanted areas.

About 2.5 mm

Fig. 4

### (5) Temporarily tighten the IC

Carefully align the pattern and IC's leads, so that the IC will be temporarily tightened to the pattern on the four leads at the corners. At this time, soldering is required, but no need to apply soldering material.

Fig. 5

### (6) Apply flux to IC's leads

Apply flux to the areas of IC's leads where soldering is to be performed. Be careful not to smear flux on the root portion of any lead or the body of IC.

Fig. 6

### (7) Soldering

While attaching the tip of the soldering iron to the soldering point as shown in the illustration, feed 2–5mm of soldering wire. Then, slowly move the iron in the direction indicated by the arrow in the illustration, so that the leads will be soldered to the pattern. Move the iron in the rate of approximately 1cm in 5sec. Proceed with your work while confirming a clean fillet of solder is formed on each lead, subsequent to the melting of flux.

Fig. 7

### CAUTION

- 1) If you move the iron too quickly, loose soldering is likely to result.
- 2) Be especially careful when soldering the first lead where loose soldering is most liable to be formed.

### (8) Check the results

When soldering of all leads is finished, check the soldered portion on every lead with a magnifying glass. A tester must not be used or checking of any soldered position

the surface of disc. Remember that the side of the disc with the "rainbow" reflection is the side containing the audio information.

Do not attach tape or paper to the label side of the disc and always be careful not to leave fingerprints on the side that is played.

### • Storing Compact Discs

Store Compact Discs in a location protected from direct sunlight, high heat and humidity and extremely high and low temperatures. Discs should never be left in the trunk or interior of an automobile in the sun since the temperature can become very high in such a closed environment.

Always store Compact Discs in the holders in which they were sold. Never leave a disc in the player's disc holder for a long period of time.

Fig. 8

### • Cleaning Compact Discs

Before playing a disc wipe off the playing surface with a soft cloth to remove dust and other soil. Wipe the surface in straight lines from the center of the disc outward, not in a circular motion as you would with a phonograph record.

Do not use benzene, chemical cleansers or phonograph record cleaning solutions to clean Compact Discs. Also avoid static electricity prevention solutions since they can damage the surface of Compact Discs.

Fig. 9

### Problems Caused by Dew

Dew can form inside a Compact player when it is brought from a cold environment into a warm room, when a room is rapidly heated and if a player is left in a humid environment.

This dew can prevent the laser pickup from reading the data contained in the pits in the disc surface. If the player does not operate properly because of dew, remove the disc and leave the player's power switch on for about one hour to remove all moisture.

## NOTE ON COMPACT DISC

### • Holding Compact Discs

Hold Compact Discs by the edges so that you do not touch

# PROTECTION OF EYES FROM LASER BEAM DURING SERVICING

This set employs a laser. Therefore, be sure to follow carefully the instructions below when servicing.

## WARNING!!

WHEN SERVICING, DO NOT APPROACH THE LASER EXIT WITH THE EYE TOO CLOSELY. IN CASE IT IS NECESSARY TO CONFIRM LASER BEAM EMISSION, BE SURE TO OBSERVE FROM A DISTANCE OF MORE THAN 30cm FROM THE SURFACE OF THE OBJECTIVE LENS ON THE OPTICAL PICK-UP BLOCK.

## LASER WARNING LABEL

The label shown below are affixed.

### 1. Warning label

### Laser Diode Properties

- Material: GaAs/GaAlAs
- Wavelength: 780nm
- Emission Duration: continuous
- Laser output: max. 0.5mW\*

\*This output is the value measured at a distance about 1.8mm from the objective lens surface on the Optical Pick-up Block.

**DANGER** —INVISIBLE LASER RADIATION WHEN OPEN AND INTERLOCK FAILED OR DEFEATED. AVOID DIRECT EXPOSURE TO BEAM.

**CAUTION** —HAZARDOUS LASER AND ELECTROMAGNETIC RADIATION WHEN OPEN AND INTERLOCK DEFEATED.

**ATTENTION** —RAYONNEMENT LASER ET ELECTROMAGNETIQUE DANGEREUX SI OUVERT AVEC L'ECLenchement DE SECURITE ANNULE. SN29360911

## ADVARSEL

"CLASS 1 LASER  
PRODUCT"

Denne mærkning er anbragt på apparatets højre side og indikerer, at apparatet arbejder med laserstråler af klasse 1, hvilket betyder, at der anvendes laserstråler af svageste klasse, og at man ikke på apparatets yderside kan blive udsat for utilladelig kraftig stråling.

APPARATET BØR KUN ÅBNES AF FAGFOLK MED SÆRLIGT KENDSKAB TIL APPARATER MED LASERSTRÅLER!

Indvendigt i apparatet er anbragt den her gengivne advarselmærkning, som advarer imod at foretage sådanne indgreb i apparatet, at man kan komme til at udsætte sig for laserstråling.

ADVARSEL USYNLIG LASERSTRÅLING  
VED ÅBNING, NÅR SIKKERHEDSAF-  
BRYDER ER UDE AF FUNKTION  
UNDGÅ UDSÆTTELSE FOR STRÅLING

VAROITUS! Laite sisältää laserdiodin, joka lähettää (näkömätöntä) silmille vaarallista lasersäteilyä.

Fig. 10

## CAUTION ON REPLACEMENT OF PICK-UP

The laser diode in the optical pick-up block is so sensitive to static electricity, surge current and etc. that the components are liable to be broken down or its reliability remarkably deteriorated.

During repair, carefully take the following precautions. (The following precautions are included in the service parts).

### PRECAUTIONS

#### 1. Ground for the work-desk.

Place a conductive sheet such as a sheet of copper (with impedance lower than  $10^6 \Omega$ ) on the work-desk and place the set on the conductive sheet so that the chassis.

#### 2. Grounding for the test equipment and tools.

Test equipments and toolings should be grounded in order that their ground level is the same the ground of the power source.

#### 3. Grounding for the human body.

Be sure to put on a wrist-strap for grounding whose other end is grounded.

Be particularly careful when the workers wear synthetic fiber clothes, or air is dry.

#### 4. Select a soldering iron that permits no leakage and have the tip of the iron well-grounded.

#### 5. Do not check the laser diode terminals with the probe of a circuit tester or oscilloscope.

### Cautions when attaching the optical pickup

- 1) Insert the pickup into the 8-pin socket in accordance with the red mark direction. If the pickup is inserted in reverse, the optical pickup will be damaged.
- 2) Arrange the pickup leads in accordance with the below view.
- 3) Use ribbon wire ties to separated the leads.

After completing the wiring, turn back the wire a small amount in the arrow direction.

## DISASSEMBLING PROCEDURES

### 1. Tray panel removal

- 1) Remove the tray with pressing the OPEN/CLOSE button.
- 2) Turn the unit over and put it on the soft cloth.
- 3) Remove the two screws from the tray.

### 2. Tray removal

- 1) Remove the top cover.
- 2) Open the tray with pressing the OPEN/CLOSE button.
- 3) Release the hook of tray from stopper and pull the tray out.

### 3. Mechanical chassis removal

- 1) Remove the top cover and tray.
- 2) Remove the three screws A from the mechanical chassis.
- 3) Remove the two connectors (P101 & P102) from the main pc board.
- 4) Pull the mechanical chassis out carefully.
- 5) Remove the two connectors (P201 & P202) from the terminal pc board.

#### 4. Arm P removal

- 1) Remove the top cover.
- 2) Remove a screw B from the bracket, holder.
- 3) Remove the arm P from the stopper.

#### 5. Replacing the spindle motor and turntable platter

- 1) Remove the tray and arm P.
- 2) Cut the points C of turntable platter with the pincers and pull it out from the shaft of spindle motor.
- 3) Remove the two screws D from the mechanical chassis.

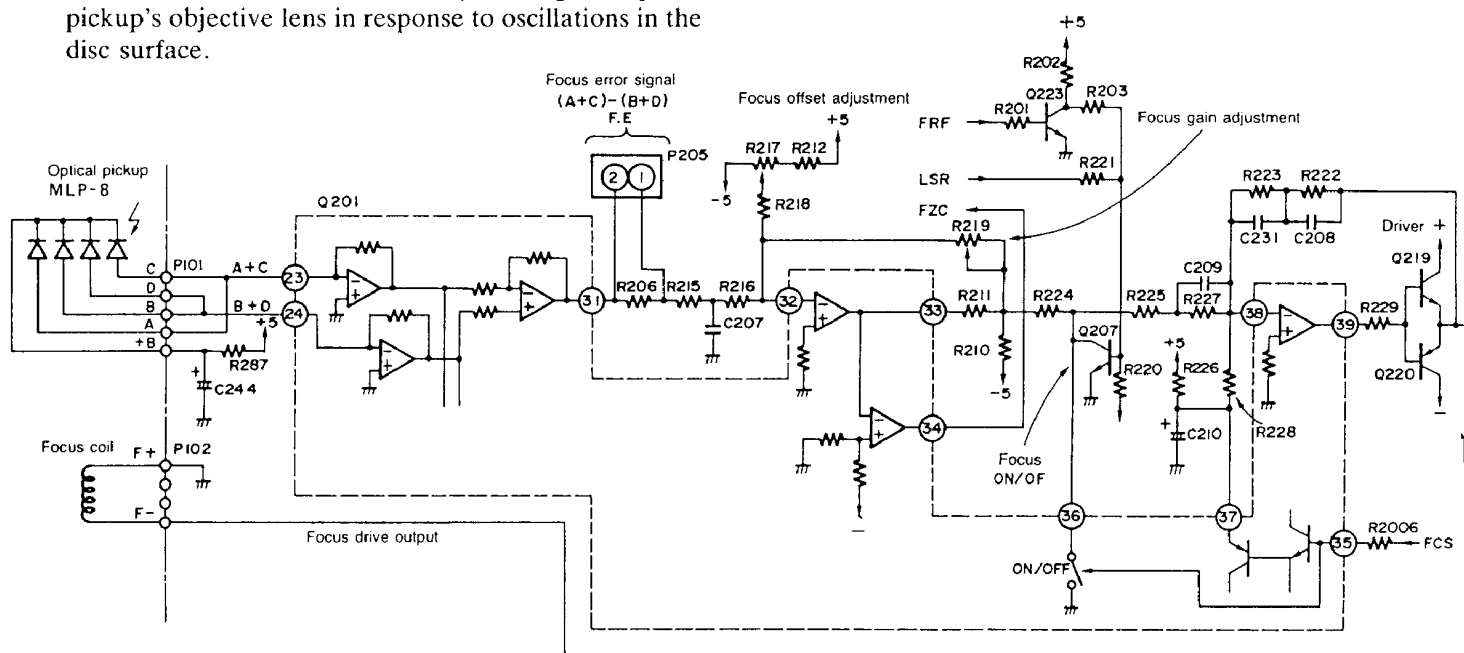

Press the center of turntable platter and insert the turntable platter in the shaft of spindle motor.

## CIRCUIT DESCRIPTIONS

## 1. Focus Servo Circuit

The focus servo ensures that the laser beam emitted by the optical pickup is always focused on the reflective surface of the disc. It does this by moving the optical pickup's objective lens in response to oscillations in the disc surface.

**Fig-1**

### 1-1. Focus Error Detector

The detector obtains the difference between the signals produced by the diagonal elements of a four-section photodiode housed in the pickup and utilizes an astigmatic method to detect focusing errors.

$$\text{FE (focus error)} = (A + C) - (B + D)$$

(A + C) and (B + D) are input into pin 23 and pin 24 of Q201 respectively. The FE signal is calculated by the three opamps in Q201 and output via pin 31.

## 1-2. Phase Correctors – Drivers

The focus error signal is relayed from Q201 pin 31 to pins 32, 33, 38 and 39 in succession. Then, after passing through drivers Q219 and Q220, it is fed back to the focus coil of the pickup.

C207, C209 and C208 are phase correctors which enhance the servo's stability. Semi-fixed resistors R217 and R219 are used to regulate offset and gain in the servo circuitry. Q207 and the switch in pin 36 turn the servo loop on and off. Control is maintained by means of the following three signals: the FCS signal sent from Q202, the FRF signal which indicates that the servo is engaged and the LSR (laser) signal sent from microprocessor Q204.

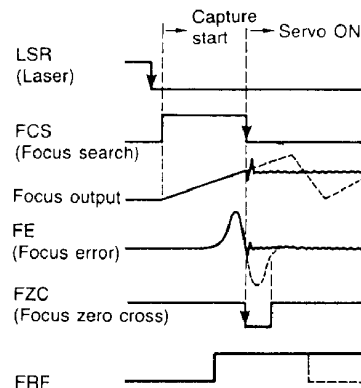

### 1-3. FZC (Focus Zero Cross) and FCS (Focus Search) Circuits

The focusing servo's capture range is only approximately  $10\mu\text{m}$ , so, when the objective lens is being moved up or down, the above-mentioned servo on/off

switch must be controlled to close the loop when the point of focus of the laser beam is positioned precisely. When a focus search command is received from the microprocessor, the LSR signal switches to LOW and a laser beam is emitted (see fig. 2). At the same time, the FCS signal switches to HIGH. C210 and R226 integrate the FCS signal creating a chopping wave, and raise the objective lens into position.

As the laser beam approaches the point of focus, the FRF signal (see fig. 2) changes to HIGH, and the FE signal builds up (+) electrical potential which falls when optimum focus is reached. This comparator's output FZC signal is output from pin 34 of Q201. According to this timing, FCS changes to LOW, and Q207 and the switch of pin 36 shut off, closing the servo loop.

Fig. 2 illustrates the timing. The dotted lines show the waveforms produced by focus capture errors.

**Fig-2**

## 2. Tracking servo

This control circuit moves the objective lens radially to keep the laser beam precisely centered in the tracks on the disc surface (which are only  $1.6\mu\text{m}$  wide).

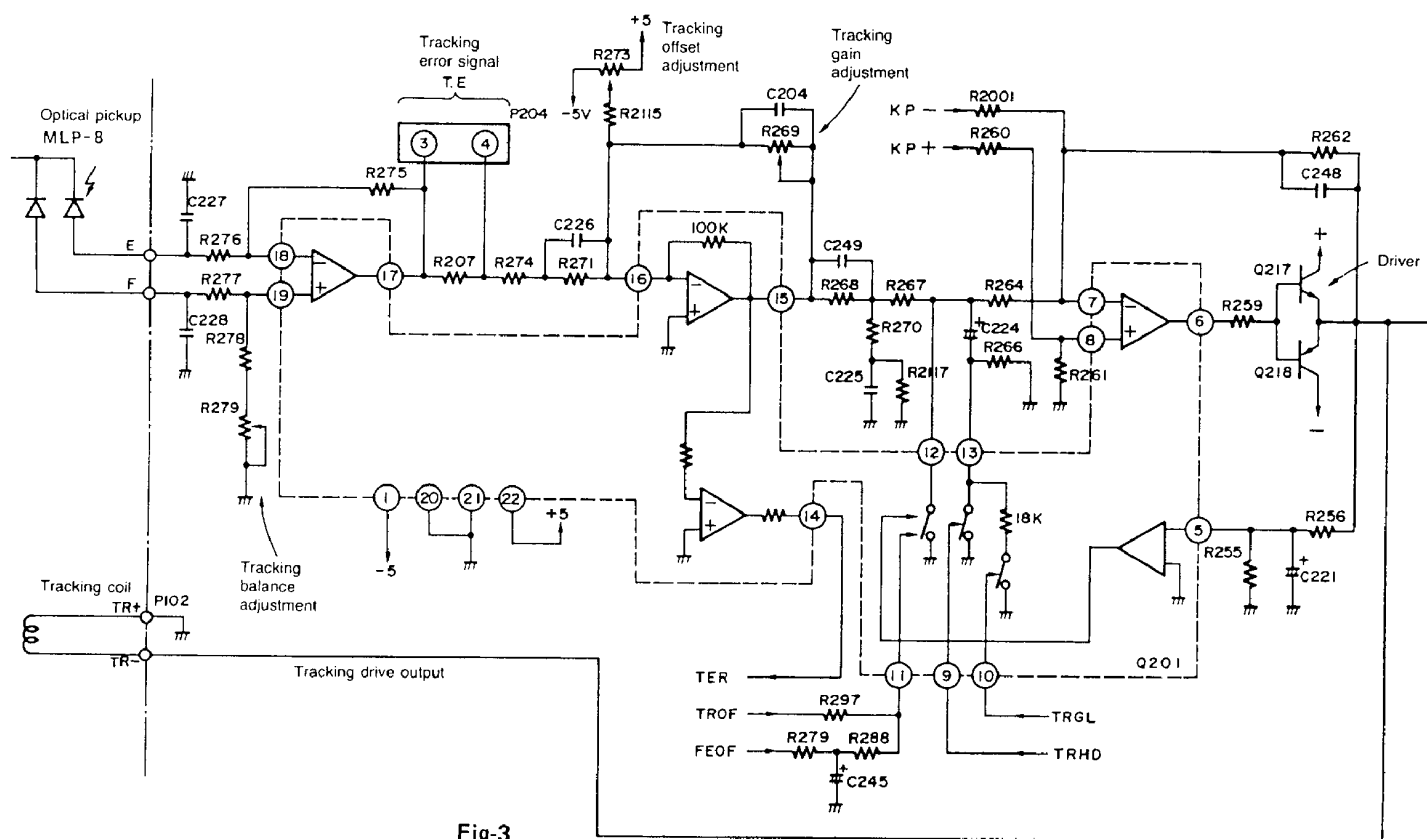

Fig-3

### 2-1. Tracking Error Sensor

This unit uses a three-beam laser pickup. The error signal is obtained from the difference between the E and F output from both sides of a four-section photodiode housed in the pickup.

$\text{T.E. (tracking error)} = F - E$

The E and F signals are input into pins 18 and 19 of Q201, the difference is obtained by an internal opamp, and the T.E. signal is output from pin 17.

### 2-2. Phase Correctors – Drivers

The tracking error signal is relayed from Q201 pin 17 to pins 16, 15, 7 and 6 in succession. After passing through drivers Q217 and Q218 it drives the tracking coil of the pickup. C226, C249, C225 and C224 are capacitors which perform phase corrections. Balance, offset and gain are regulated by semi-fixed resistors R279, R273 and R269 respectively.

The switches incorporated in pins 12 and 13 of Q201 turn the servo on and off and switch the high frequency range loop gain on and off, thereby helping to stabilize transient operation during access times. The timing of

these switches is determined by the input into pins 9 – 11 of Q201. The commands are as follows:

TROF (tracking OFF) FEOF (feed OFF)

TRGL (tracking gain low) TRHD (tracking high down)

Signals are output from Q202 in response to commands from microprocessor Q204.

### 2-3. TER circuit

The TER signal is one of the sensors that determines the switch timing mentioned above. It is produced by running the tracking error signal output from pin 15 through a comparator at the ground level and then output through pin 14.

#### 4. Slide Motor (Feed Motor) Circuit

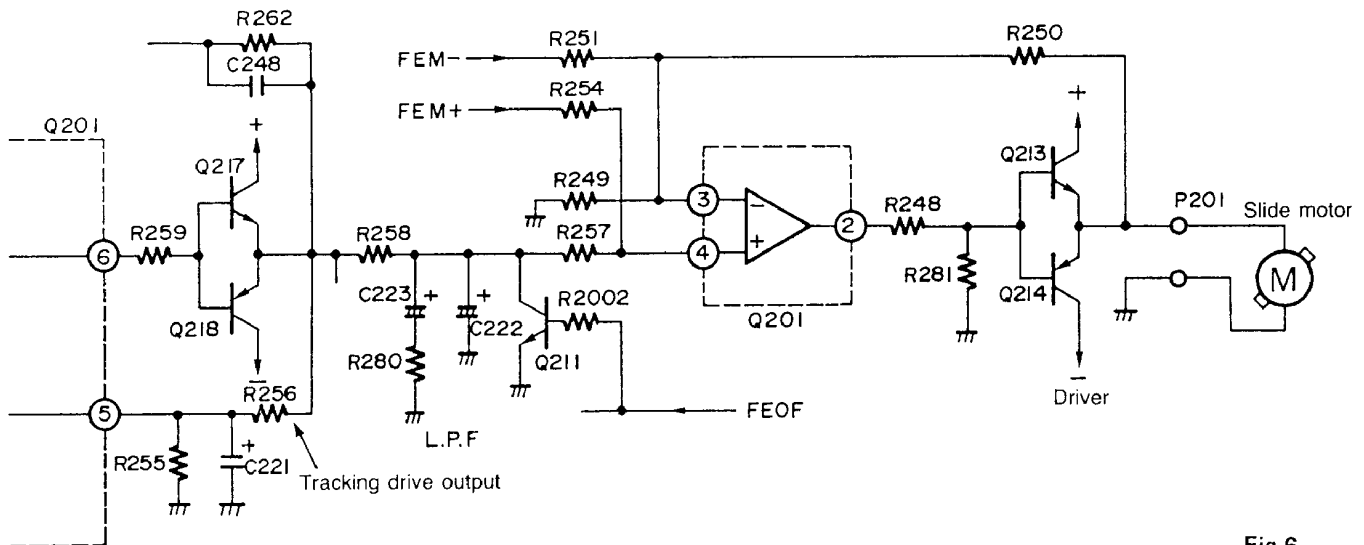

Fig-6

This servo circuit moves the entire pickup assembly from the disc's hub to its outer edge, ensuring that the objective lens stays close to the optical axis.

C222, C223, etc. remove low-frequency elements from the tracking drive's output. It then passes successively through pins 4 and 2 of Q201 and then drives the motor via drivers Q213 and Q214.

Q211 is the transistor that turns the slide servo on and off. It is controlled by the FEOF (feed off) signal sent from Q202.

Motor fast forward and reverse are initiated by FEM- (feed motor -) and FEM+ (feed motor +) signals input into pins 3 and 4 of Q201 for smooth disc access.

#### 5. Spindle Motor Servo

This servo consists of a PLL circuit which extracts the clock signal from the HF signal the pickup reads from the disc and a circuit which controls the spindle motor based on this clock signal.

##### 5-1. PLL Circuit

The PLL circuit consists of VCO, LPF and a phase comparator in Q202 as shown in fig. 7.

The 8.64MHz VCO oscillator output is divided in half inside Q202. The phase of the HF signal and the waveformshaped EFM signal edge are compared and the result output through pin 4.

When PLL is locked, LPF output from pin 7 of Q210 is approximately 2.5V and the SYEQ (sync equal) terminal (Q202, pin 10) changes to HIGH.

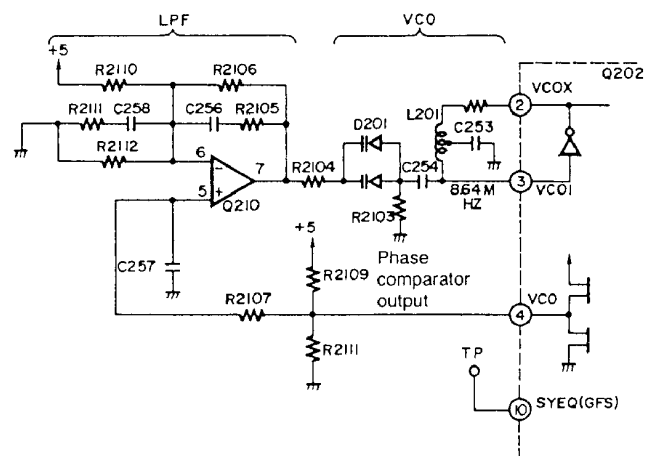

Fig-7

##### 5-2. Spindle Motor Circuit

The spindle motor is controlled by DM+ (disc motor +) and DM- (disc motor -) commands output from pins 11 and 12 of Q202. Two opamps perform phase correction and amplify the signals which are then sent to the spindle motor via drivers Q215 and Q216.

## 2-4. Track Kick Circuit

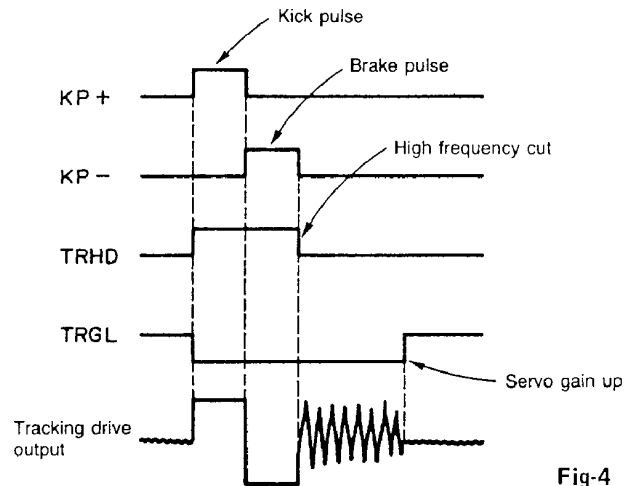

This circuit is used to move the laser beam to a target pit over relatively short distances (approximately 1–100 tracks) during such operations as disc access and cue review. In conjunction with the on/off switching discussed above, it sends positive and negative “kick pulses” (KP+ and KP–) to pins 7 and 8, thereby shifting the tracking coil by the desired amount.

The timing is determined by signals such as the TER signal and the HFD signal (see below). Fig. 4 illustrates the timing during a typical “kick” operation (forward).

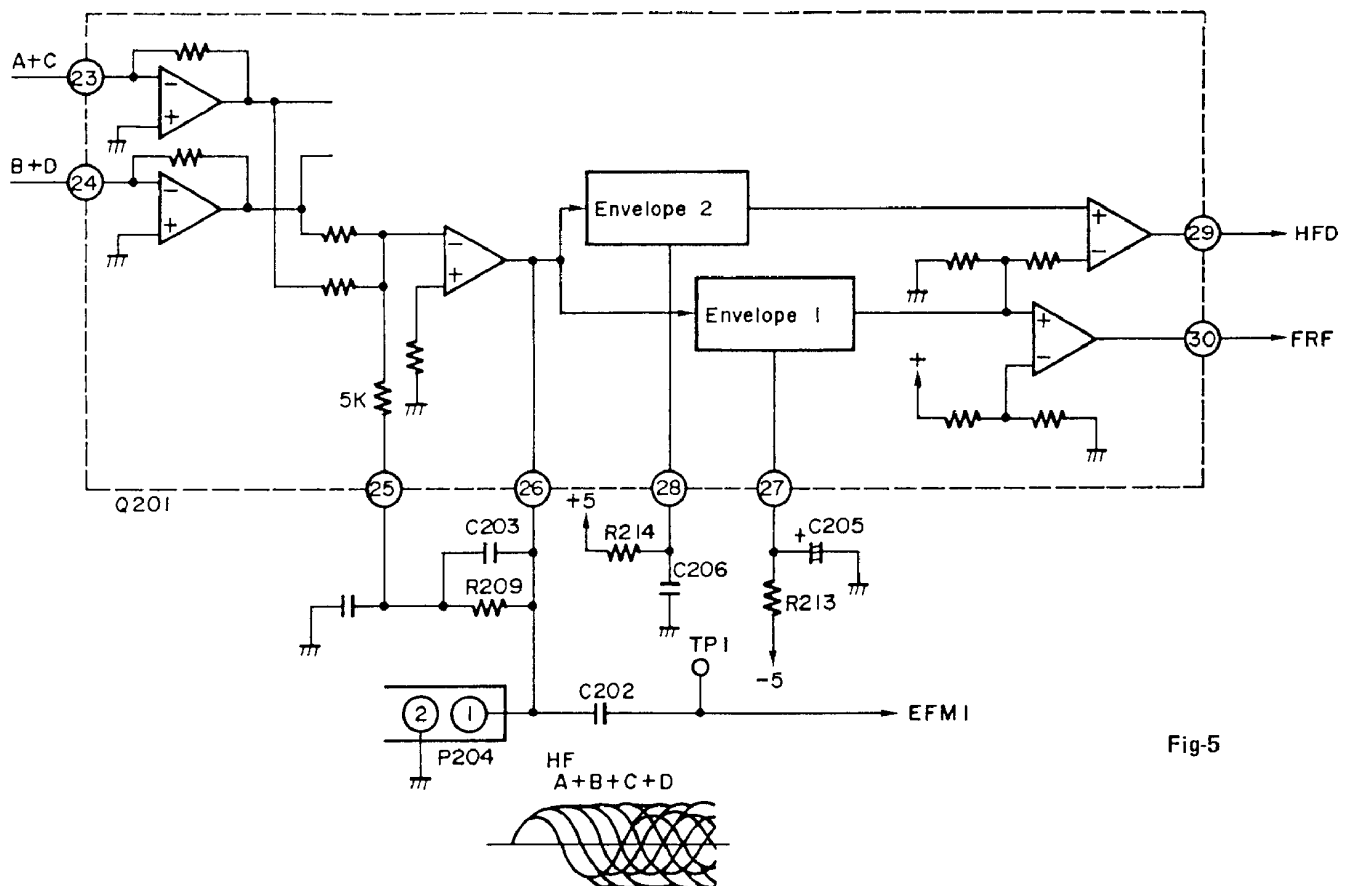

### 3. HF (RF) Amp

The HF (RF) amplifier block amplifies the HF (RF) data encoded on the disc (in other words the entire output from the four-section photodiode) and sends it to the processing circuit block. In addition, it constantly checks the status of the servo and detects the signals which determine timing.

$$\text{H.F. (R.F.)} = A + B + C + D \leftarrow \text{Eye-Pattern}$$

**Fig-4**

**Fig-5**

### 3-1. HF Amp

The A + C and B + D signals are input from pins 23 and 24 of Q201. They are added together by an opamp and the resulting signal (the HF signal) appears at pin 26. The HF signal is then passed through C202 and sent to the EFMI terminal of Q202 for signal processing.

### 3-2. HFD and FRF Signals

The HF signal is input into C205 and C206, two envelope detection circuits with different time constants. The output is put through a comparator at a certain level and the HFD and FRF signals are then output via pins 29 and 30. The FRF signal indicates that focus is on; it is HIGH when focus is on. The HFD (HF detector) detects such things as the flat sections between pits and scratches on the disc surface. Together with the TER signal, it determines switching timing during disc access, etc.

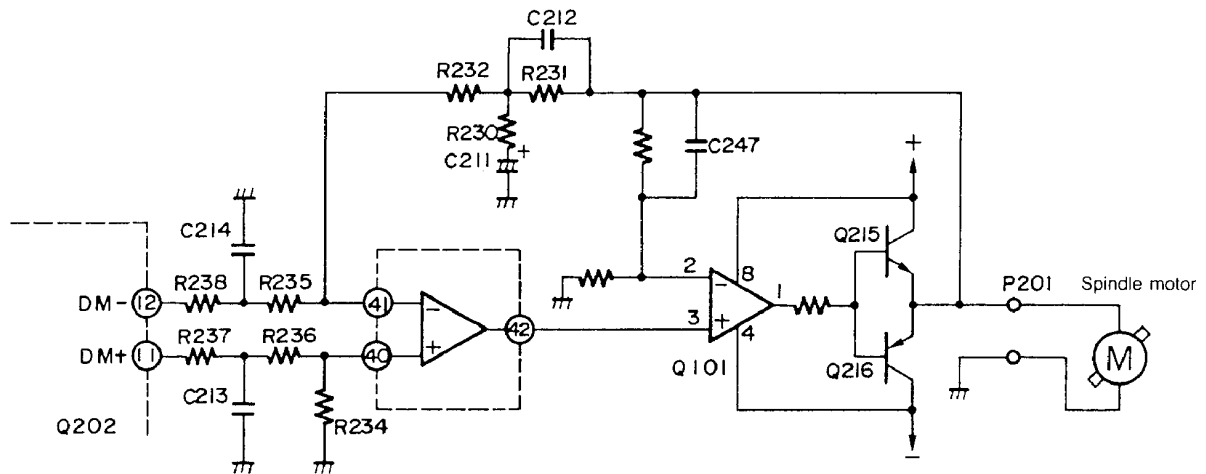

Fig. 8

## 6. HF Signal Waveform-shaping Circuit

This circuit shapes the HF signal and converts it into a binary value. However, since asymmetry (i.e. lack of symmetry between the top and bottom of the HF signal which can adversely affect the DC balance) caused by dispersion during disc manufacture cannot be eliminated by AC linking alone, DC components from the EFM (eight to fourteen modulation) signal are fed back after shaping for slice level processing. The slice level output from Q210 pin 1 is approximately 2.5V during normal operation.

Fig. 9

## 7. APC Circuit

The laser diode is extremely temperature sensitive. For this reason, the APC (auto power control) circuit, which continuously monitors the laser output and feeds it back, is essential.

Negative feedback control is performed on the output signal from the monitor diode inside the laser pickup by Q101. Q103 switches the laser on and off in response to the LSR (laser) command from the microprocessor.

## 8. Microprocessor (Q204) Peripheral Circuit

### 8-1. Display Controller (Q204)

The dynamic scan technique used by the display controller is driven directly by 8-digit output from pins 5 – 12 of Q204 and 8-segment data output from pins 17 – 20 and 22 – 25. The duration of each digit is approximately 1ms with cycles of  $1 \times 8 = 8$  ms (125Hz).

### 8-2. Key Input Processor (Q204)

The processor uses the display digits as is without alteration. Q204 uses a  $4 \times 3$  matrix configuration and accepts key input through pins 26 – 29 (regular logic). This matrix also controls three remit switches (open/close, pickup reset) as well as timer switches, etc.

### 8-3. Remote Control Signal Processing (Q402, Q204)

Output from infrared sensor U401 is sent to pin 15 of Q402 where noise from sources such as fluorescent lights is removed. Then it is output from pin 14 and sent to Q203 pin 37. Fig. 10 shows a typical remote control waveform.

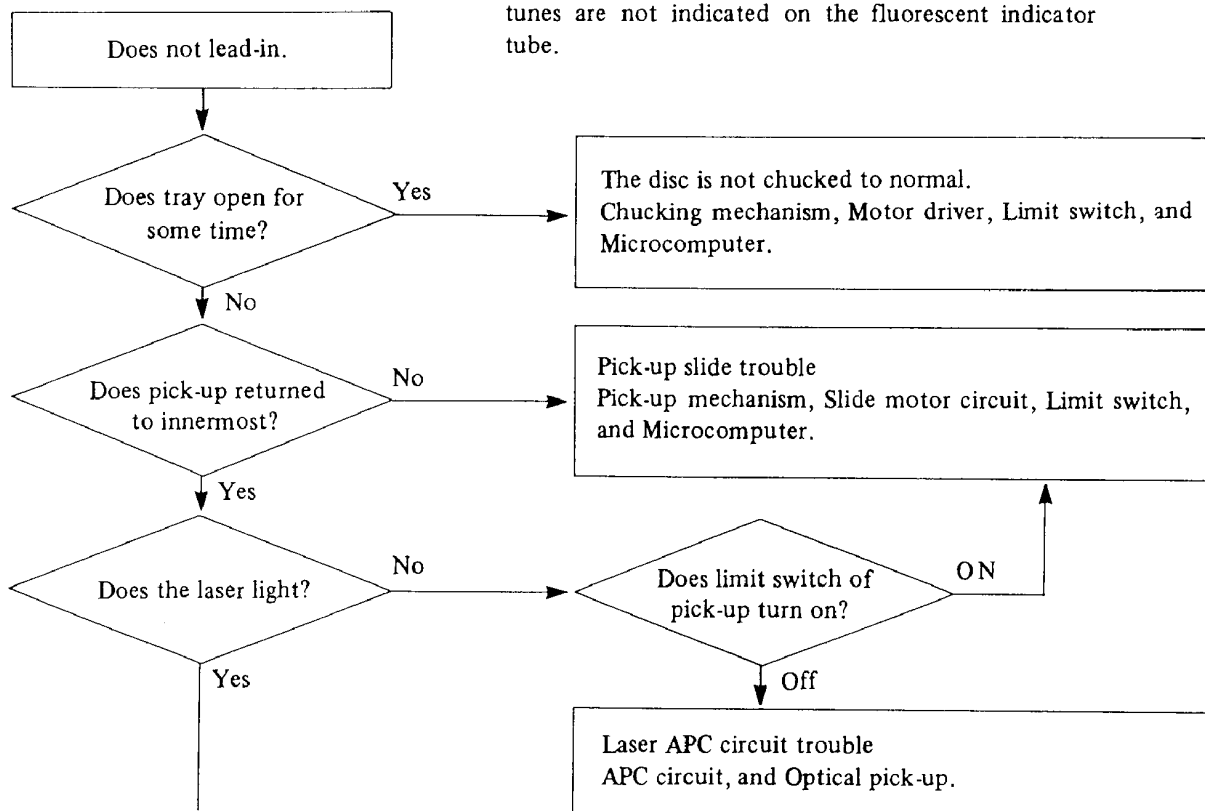

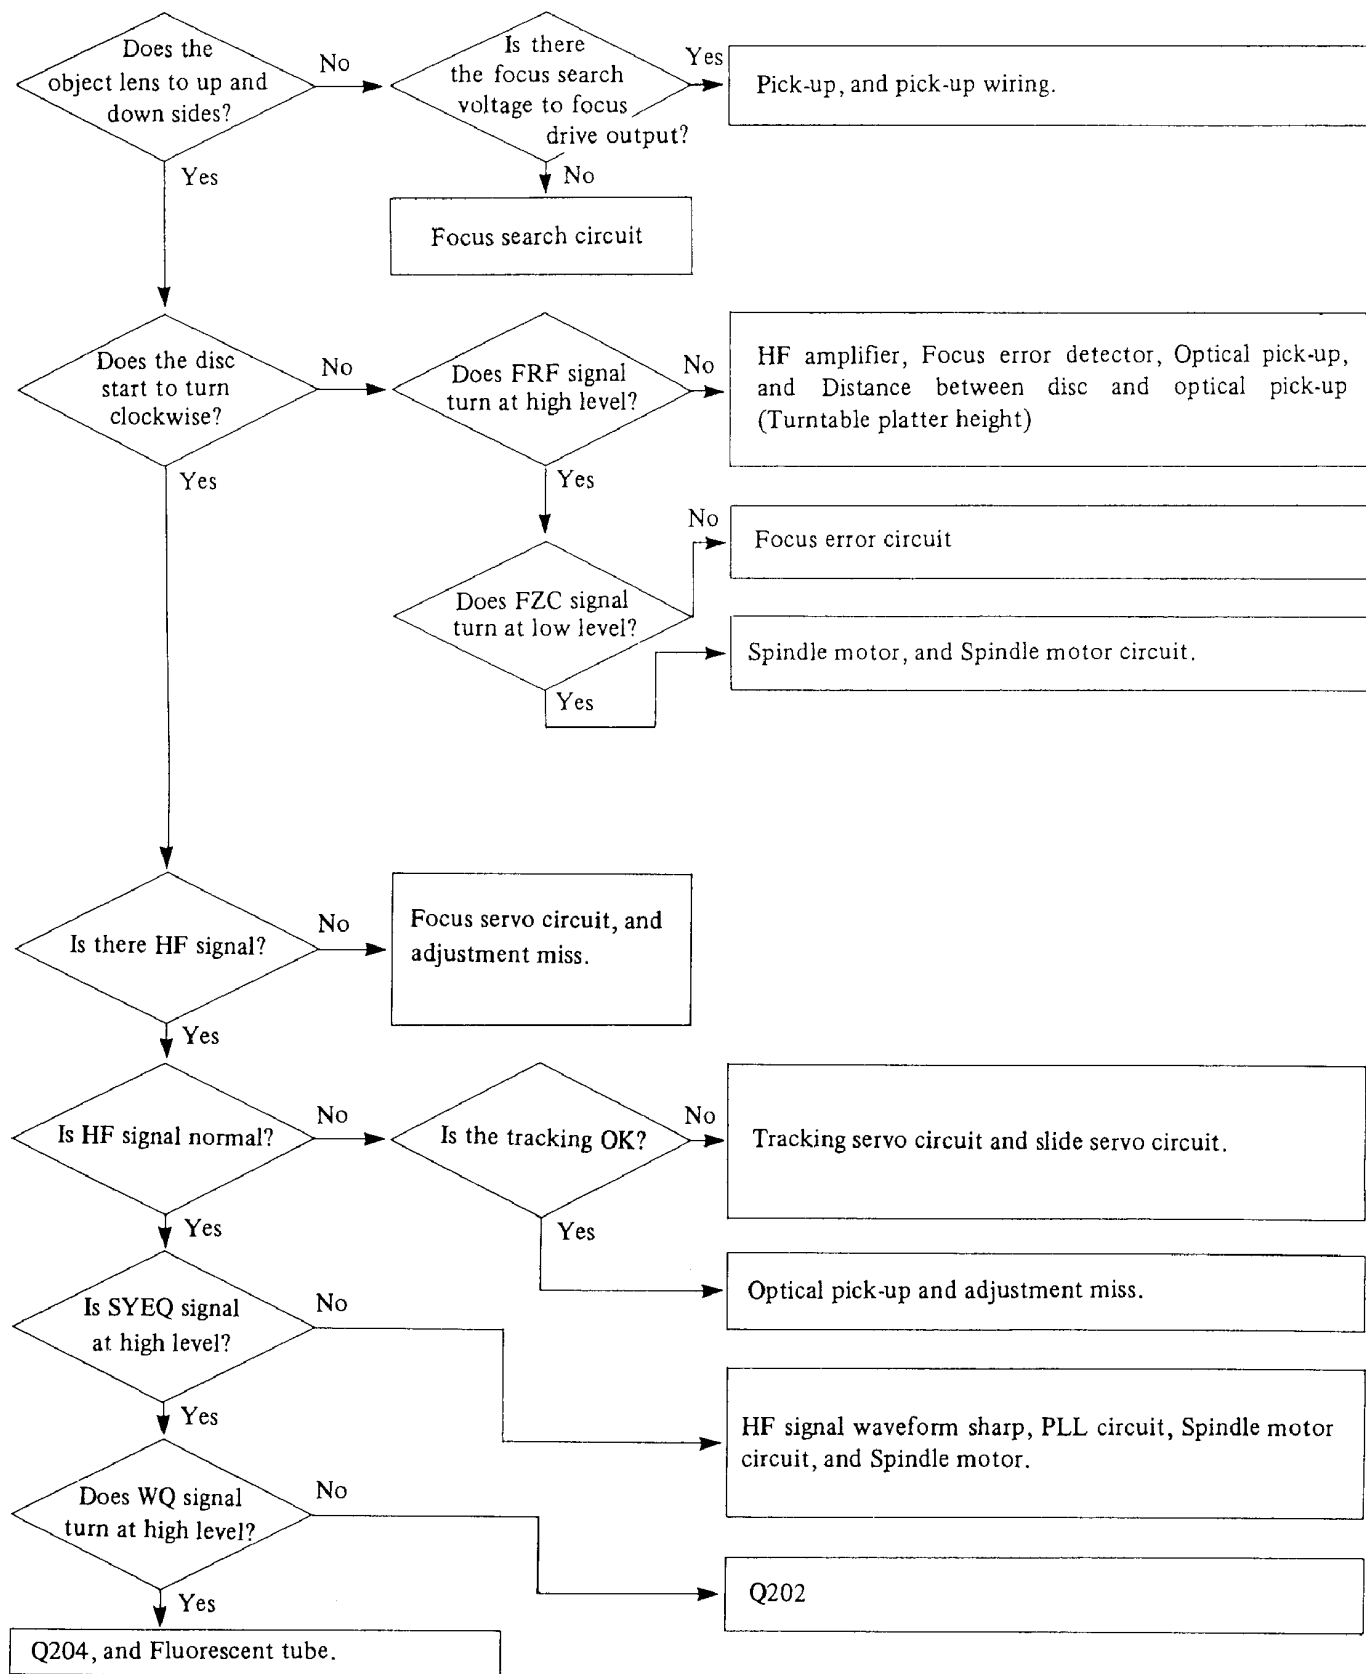

Fig. 10

## TROUBLE SHOOTING GUIDE

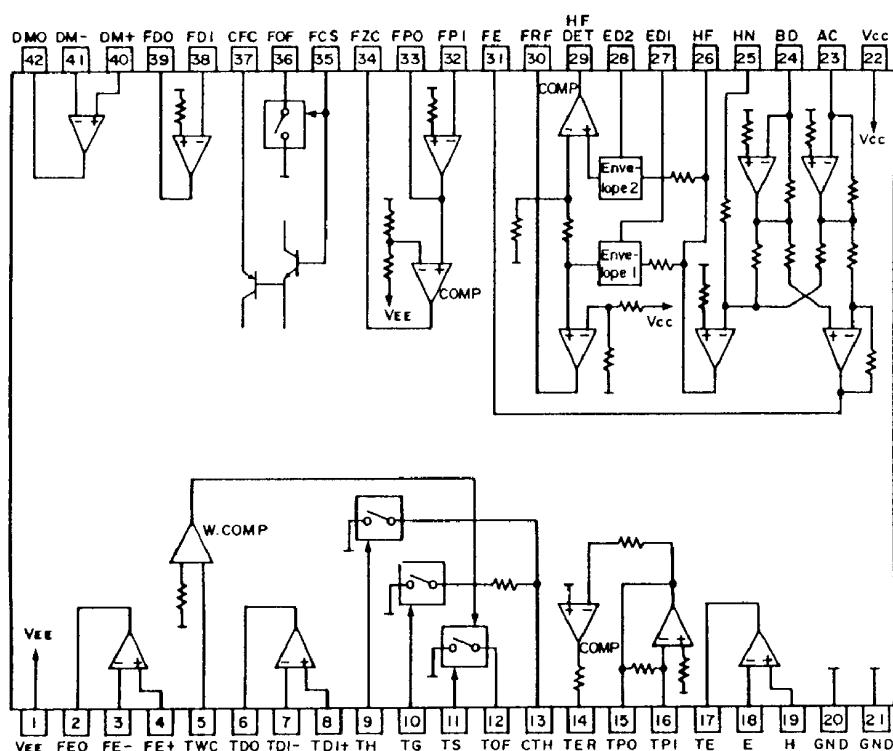

Load the disc on the tray, press OPEN/CLOSE key and close the tray. But, total play time and total number of tunes are not indicated on the fluorescent indicator tube.

# IC DESCRIPTIONS

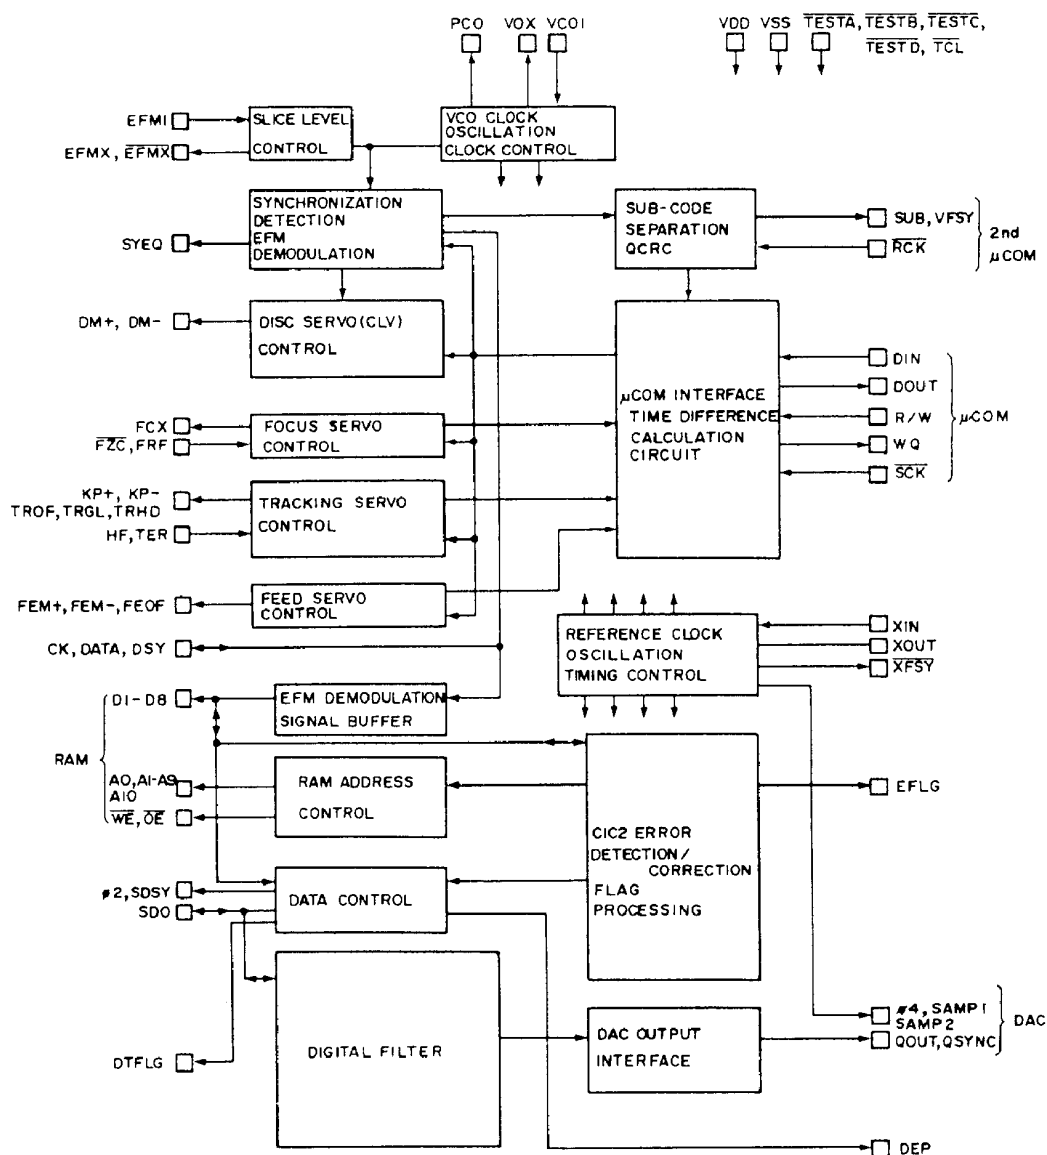

## XB087A0(Servo Linear Circuit)

Pin No.	Designation	Function
2~4	FEO, FE-, FE+	Feed drive amplifier drives the feed power amplifier and is rotated the feed motor.
5	TWC	Terminal of tracking drive limiter to tracking coil. The reference voltage of this circuit is about $\pm 0.67V$ .
6~19		Tracking servo system terminals.
6~8	TDO, TDI-, TDI+	Tracking drive amplifier drives the tracking power amplifier and actuates the tracking actuator.
9~11	TH, TG, TS	Tracking jump control switches. TH: Tracking hold switch TG: Gain control switch TS: Tracking offset switch
12~13	TOF, CTH	These terminals are controlled the tracking loop by TH, TG and TS (pins 9, 10, and 11).
14	TER	The output terminal of comparator of tracking zero cross.
15~16	TPo, TPi	Input/Output terminals of tracking preamplifier.
17~19	TE, E, F	This circuit is constituted by I-V conversion and differential amplifier. The reflected sub beams are converted into electric signals by the E and F, and the mutual differences are obtained as a tracking error signal.
23~39		Focus servo system terminals.
23~24	AC, BD	Input terminals from main spot of photo diode.
25~26	HN, HF	Feedback terminal and output terminal of HF (RF) signal.
27~28	ED1, ED2	Terminals for peak hold (pin 27) and bottom hold (pin 28) of HF (RF) signal.
29, 30, 34		Output terminals of servo IC to control the focus tracking.
29	HF	HF output is L level on the track of disc and H level on mirror section.
30	FRF	This circuit is the focus servo to on when comes the focus point from focus search condition.

Pin No.	Designation	Function
34	FZC	Use when the focus search. Same as FRF
35	FCS	Signal input terminal to pull the focus.
36	FOF	Attenuator terminal.
37	CFC	Terminal to make the ramp waveform of focus search ramp circuit.
38~39	FDi, FDo	Input/output terminals of focus drive amplifier.
40~42	DM+, DM-, DMo	Input/output terminals of disc drive amplifier.

## YM3805 (Signal Processor &amp; Controller)

Pin No.	Designation	Function
79, 80	79 × IN and 80 × OUT	Clock Oscillator (8.6436MHz)
6~8	8 EFMI, 7 $\overline{\text{EFMX}}$ , and 6 EFMX	EFM External Circuit
2~4	4 PCO, 3 VCO1, 2 VCOX	Clock Regeneration Circuit
10	SYEQ	WYNC Match Signal
27~29	27 CK, 28 DATA, and 29 DSY	FM Demodulation Signal Check Output
30, 31, 33	30 SUB, 31 VFSY, and 33 $\overline{\text{RCK}}$	Sub-code Output
35~37, 39	35 WQ, 36 R/W, 37 DOUT, and 39 $\overline{\text{SCK}}$	Q-code Output related Pins
36, 38, 39	36 R/W, 38 DIN, and 39 $\overline{\text{SCK}}$	μ COM Command related Pins
13~15	Input 14 $\overline{\text{FZC}}$ – 15 FRF, and Output 13 FCS	Focus Servo-mechanism related Pins
11, 12	11 DM+, and 12 DM–	Disc Servo-mechanism Pins
16, 17 19~23	Input 16 HF, and 17 TER Output 19 TROF, 20 TRGL, 21 TRHD, 22 KP+, and 23 KP–	Tracking Servo-mechanism related Pins
24~26	24 FEOF, 25 FEM+, and 26 FEM–	Feed Servo-mechanism related Pins
40, 42~61	40A0–53A10, 51 $\overline{\text{WE}}$ , 52 $\overline{\text{OE}}$ , and 54D8–61D1	RAM Connection
75	75 $\overline{\text{XFSY}}$	Crystal Clock SYNC Signal
73	73 EFLG	C1 and C2 Error Correction Check Signal
34, 66, 67 69, 71, 63	34 φ2, 66 SDO, SDSY, 63 DTFLG 69 TEST A, and 71 TEST C	DATA Control Circuit-Serial Signal Output
64, 65 68, 76, 77	65 Q OUT, 64 Q SYNC, 76 SAMP1, 77 SAMP, 2 and 68 φ4	DAC Interface
62	62 DEP	De-emphasis Signal
8, 18 69~71	69 TEST A, 70 TEST B, 71 TEST C, 18 TEST D, and 8 TCL	Test Pins

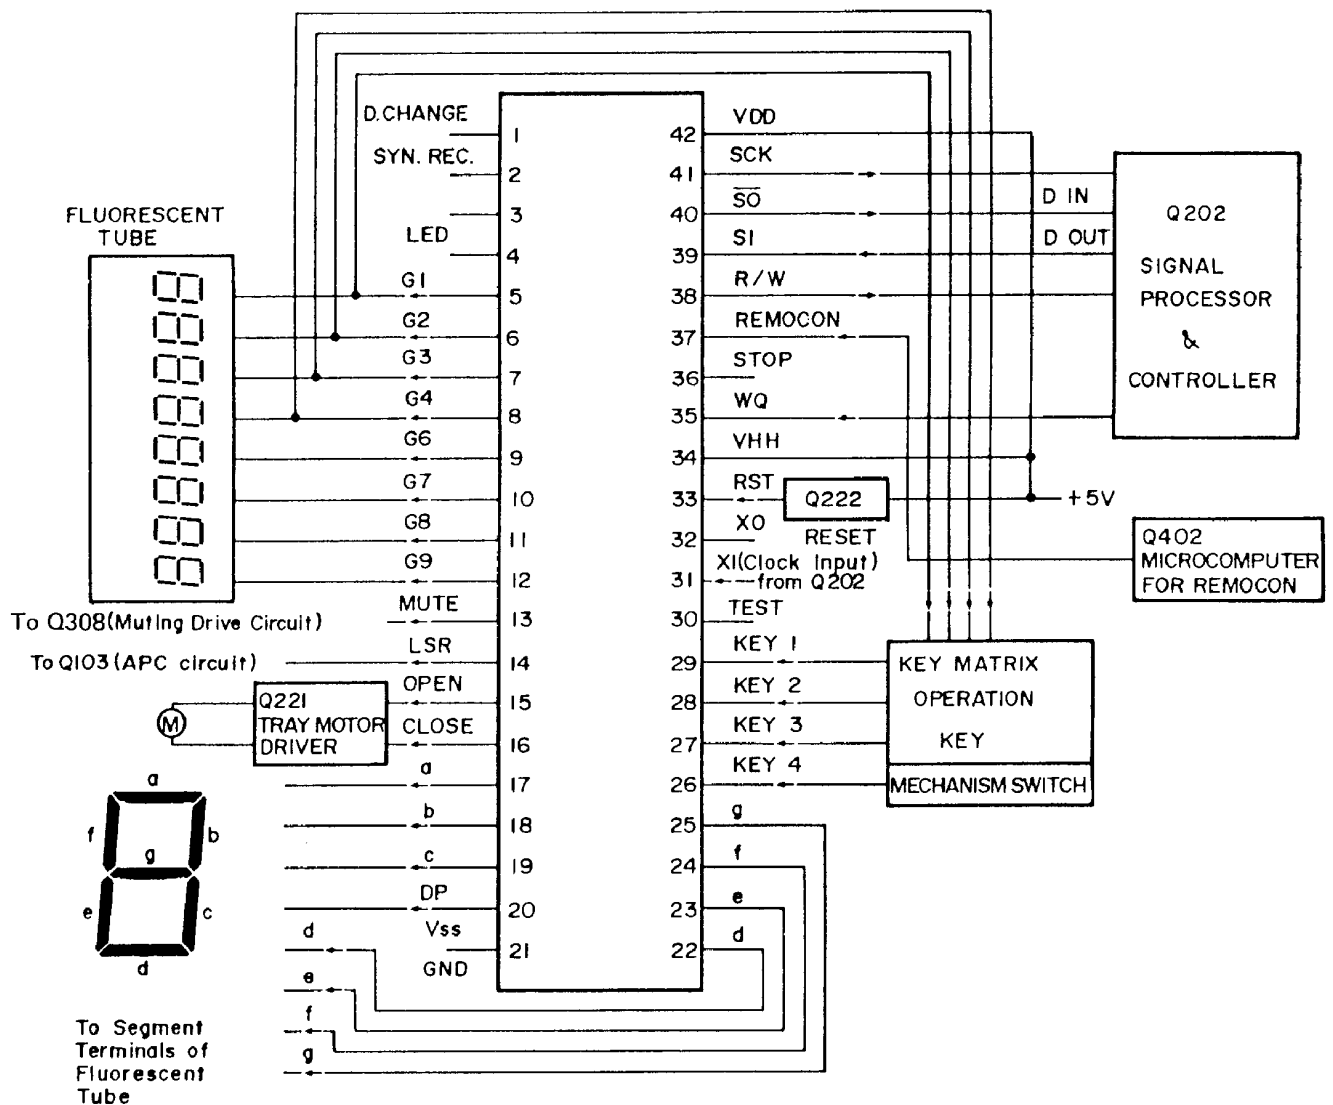

## XK5816M-15/HM6116F-P4(16bit RAM)

## TA7354P (Motor Driver)

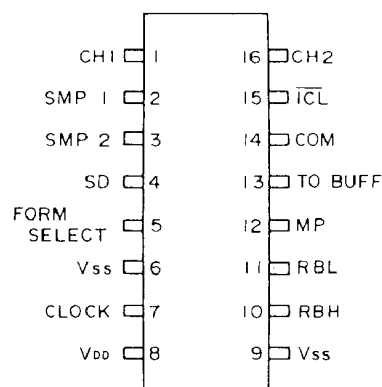

## Connection of Micro Computer

Pin NO.	Terminal	Description
5~8 9~12 17~19 20 22~25	G1-G4 G6-G9 a-c DP d-g	Control of fluorescent display tube is used the dynamic driver method. The digit datas of eight figures and eight segment datas are output from microcomputer.
13	MUTE	Audio muting control output for audio muting when the disc is stopped, and during accessing operations and pause mode. Muting is applied when the output is at high level.
14	$\overline{\text{LSR}}$	Optical pick-up laser on/off control output. Laser is on when the output is at low level.
15 16	OPEN CLOSE	These signals used to control disc tray opening and closing operations. Control signals are passed direct from the microcomputer to pins 5 and 6 of the Q221 tray motor driver.
26	KEY 4	The condition of mechanical switches (open, close, and start) is processed, and data of switches is read by KEY 4 input port.
27~29	KEY 3-KEY 1	A 12(4x3) matrix is formed by using the digit datas. (Positive logic)
31	X1	Clock input from Q202.
33	RST	Using an IC designed specifically for microcomputer resetting, a reset output (low level) is applied to the microcomputer RST terminal when +5V line voltage drops below 4V reference voltage. This pin is normally switched on, and subsequently kept at high level.
37	REMOCON	Remote control input terminal. 
35	WQ	Write request: High level when transmit the information to micro computer.
38	R/W	Read/Write: High level when transmit the command from micro computer.
39	SI	Serial input: Transmit the servo system condition and sub-code data to micro computer.
40	$\overline{\text{SO}}$	Serial output: Transmit the command data from micro computer to servo system.
41	SCK	Serial clock: Clock of serial data. Data is shifted at trailing edge.

## YM3020 (D/A CONVERTER)

Pin No.	Designation	Function (Assignment)
1.	V OUT CH1	Sample-hold analog switch output for Channel 1.
2.	SMP 1	Interval of signal at state "1" will be the sampling time of CH1.
3.	SMP 2	Interval of signal at state "1" will be the sampling time of CH2. The rising edge of SMP 1 and SMP 2 is used to generate the internal signal to latch the serial data. The level frequency characteristics will be improved as the signal time of SMP 1 and SMP 2 becomes longer.
4.	SD	Serial input of converted digital signal.
5.	FORM SELECT	Corresponds to binary input at state "1", and corresponds to 2's complement input at state "0".
6.	Vss	Low-potential side power (GND).
7.	CLOCK	Clock to drive shift-resistor and time-generator ( $\phi 4$ ).

Pin No.	Designation	Function (Assignment)
8.	V <sub>DD</sub>	High-potential side reference power.
9.	V <sub>SS</sub>	Low-potential side reference power (GND).
10.	RBH	Since the same resistance is inserted between the RBH pin and the internal V <sub>DD</sub> power supply and between the RBL pin and the internal V <sub>SS</sub> (GND) power supply, a high precision voltage of 1/2 V <sub>DD</sub> can be obtained when both pins are connected. This voltage is applied on the MP pin through the buffer operational amplifier.
11.	RBL	As in the case of the basic circuit, the drift from 1/2 V <sub>DD</sub> can be corrected by providing an appropriate external resistance on either one of the two pins.
12.	MP	An exponential analog shift is executed with the potential applied on MP as the reference. Normally, bias is appoied for 1/2 V <sub>DD</sub> .
13.	TO BUFF	Analog output of DAC is input to buffer operational amplifier.
14.	COM	Common input of analog switch for CH1 and CH2.
15.	ICL	"1": Normal operation. "0": Will become no-signal output regardless of D signal.
16.	V <sub>OUT</sub> CH2	Sample-hold analog switch output for CH2.

### NJM-455814560 (Operation Amplifier)

### NJM-4556S (Operation Amplifier)

## ADJUSTMENT PROCEDURES

### Instruments required

Dual trace oscilloscope, Frequency counter, CR oscillator, Test disc (SONY YEDS-18 TYPE4), Short clip, Resistor 1kohm

#### 1. VCO frequency adjustment

Turn the power switch to ON.

Connect the frequency counter to the pin 2 (CK) of P203.

Connect the pins 1 (HF) and 2 (GND) with the short clip.

Adjust L201 until the frequency counter reading 4.35MHz.

After adjustment, remove the frequency counter and short clip.

#### 2. Focus offset adjustment

Load the test disc YEDS-18 and play back the track 2.

Connect the oscilloscope to pin 1 of P204.

Set R217 to mechanical center.

Adjust R217 until a clear trace of waveform pattern as shown photo 1 appear on the oscilloscope.

After adjustment, remove the oscilloscope.

Photo 1

### 3. Focus gain adjustment

Connect the dual trace oscilloscope to pins 1 (CH1) and 2 (CH2) of P205 at play condition.

Apply a sine wave 500mVp-p at 1kHz via resistor 1k $\Omega$ m from CR oscillator to pin 1 of P205.

Adjust R219 so that the waveforms of channel 1 and channel 2 become same level. (Refer photo 2).

After adjustment, remove the CR oscillator and oscilloscope.

Photo 2

### 4. Tracking balance adjustment

Turn R269 to minimum position (counter-clockwise) at play condition.

Connect the oscilloscope to pin 3 (TE) of P204.

Adjust R279 until both positive and negative peaks of the waveform becomes equal at 0V level. (Refer photo 3)

After adjustment, set R269 to mechanical center and remove the oscilloscope.

Photo 3

### 5. Tracking offset adjustment

Connect the oscilloscope to the emitter of Q214 (Output of slide motor) at play condition.

Connect the pins 4 (T.E) and 2 (GND) of P204 with the short clip.

Adjust R273 until both positive and negative peaks of the waveform becomes equal at 0V level.

After adjustment, remove the oscilloscope and short clip.

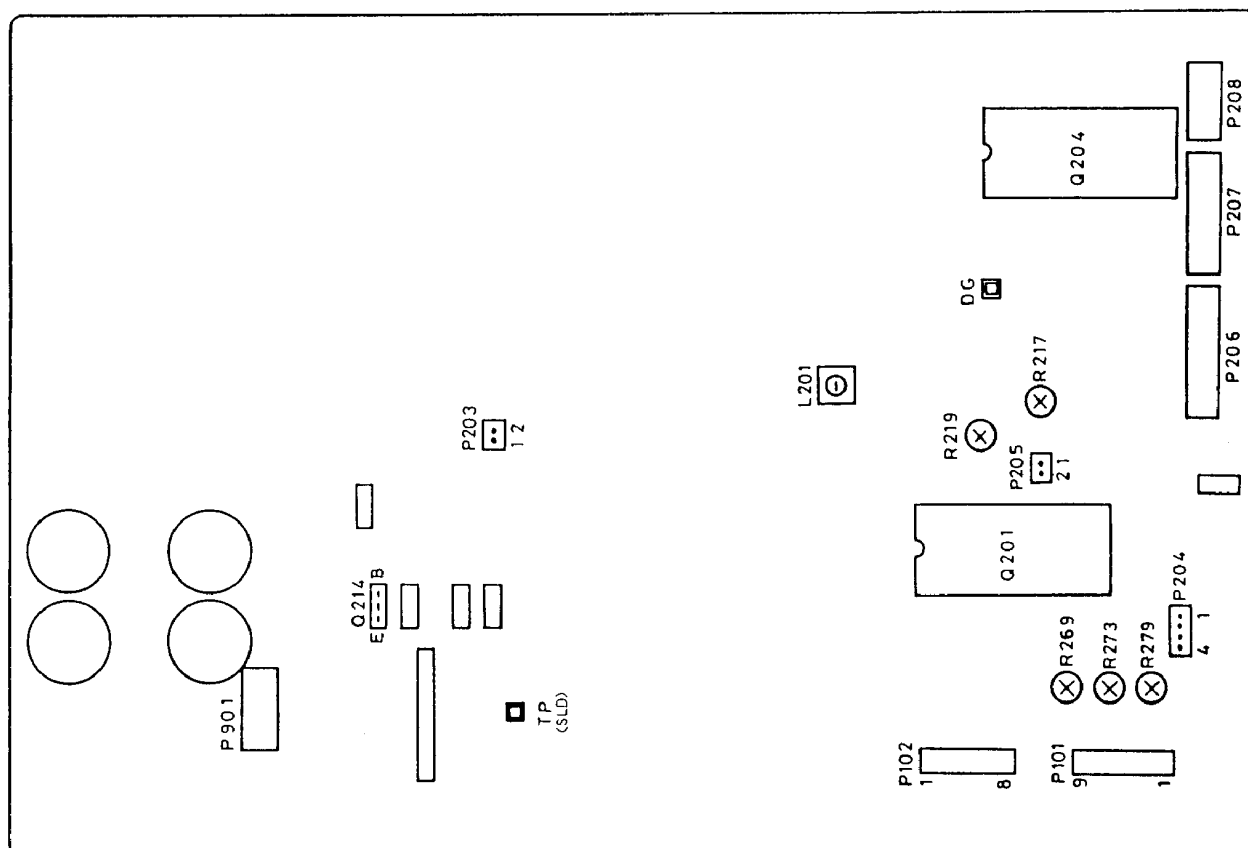

### 6. Tracking gain adjustment

Connect the dual trace oscilloscope to pins 3 (CH1) and 4 (CH2) of P204 at play condition.

Apply a sine wave 1 V<sub>p-p</sub> at 1.2kHz via resistor 1k $\Omega$  from CR oscillator to pin 4 of P204.

Adjust R269 so that the waveforms of channel 1 and channel 2 become same level. (Refer photo 4).

After adjustment, remove the CR oscillator and oscilloscope.

Adjustment Point
